In this particular case I've changed the file name so that it is not overly obvious what the script is doing.Dermal bioadhesive application of human papillomavirus (HPV) type 16/18 DNA vaccine E2/L2 elicits a highly significant anti-tumor response in a genetic mouse model. Recent advances in DNA vaccine development have demonstrated that specific cellular immune responses can be produced to foreign antigens. The ability to target antigens to both local and distal lymphoid tissues could be an important route to significantly increase the efficacy of DNA vaccine technology. Adjuvants have been shown to be capable of increasing the immunogenicity of DNA vaccines by enhancing the immune response at the site of delivery. In the present study, the vaccine efficacy of the HPV16 E2/L2 DNA vaccine delivered through gene gun-induced dermal delivery (2 x 10⁷) particles) with or without the addition of TiterMax was evaluated using a murine fibrosarcoma cell line, K1735. The results showed that in the mice treated with E2/L2 vaccine alone, no tumor protection was observed. However, in mice that received E2/L2 with TiterMax (5% Methocel, by weight), tumor protection was observed. Mice receiving E2/L2 + Methocel showed a significant survival rate with tumor protection of 87%. These results demonstrate that the dermal application of HPV16 E2/L2 DNA vaccine with a dermatological adju
